

# MeetFlow

Extra / Differentiator Features — beyond a standard video-meeting app

---

This document lists the features that make MeetFlow more than a basic video-conferencing clone — the AI-driven and college-specific additions layered on top of the core meeting platform.

## 1. AI Agent Differentiators

---

- Human-in-the-loop summaries — the Summarizer Agent's draft is never published directly; the host reviews, edits, or regenerates it first.
- Q&A; Agent identifies the exact meeting by having the user pick it from a list of meetings they've attended (title, host, date, time) rather than typing a room code — since multiple meetings can run at the same date/time and a person can't be expected to remember codes.
- Q&A; jump-to-timestamp, multi-meeting search, conversational follow-ups, and a confidence/source indicator (which speaker said it, and when) so answers feel trustworthy rather than guessed.
- Host-selection escalation — if the AI isn't confident in an answer, the person is shown the list of hosts whose meetings they've attended and picks which one to forward the question to; the host's answer is saved so the AI can auto-answer it next time.
- Doubt Log dashboard — shows the host which questions come up often or are unclear, highlighting what wasn't explained well in the meeting.
- Highlight reel — AI clips the 3-4 most important moments (based on decisions/action items) into short video snippets, viewable alongside the recording and summary in that meeting's Archive entry.
- Live translation/captions for multilingual participants during the call.
- Noise/background voice filtering during recording.

## 2. Smart Scheduling

---

- Faculty Availability — faculty mark themselves Available, Busy, or Do Not Disturb; when scheduling, the Scheduler Agent suggests the best overlapping time along with how many faculty are free at that time (e.g. "Best time 11:30-12:00, 7/8 faculty available") — a strong problem-solving feature for a college setting.
- Reminder Agent only notifies about meetings a person has explicitly added to their own calendar — not every meeting they're merely invited to — and separately follows up on pending/overdue tasks.
- Participants can add a host-scheduled meeting to their own calendar using its auto-generated room code, which then enables reminders and one-click join when the time comes.
- Reschedule flow — if a host reschedules a meeting to a new date/time, the room code stays the same, and every participant who had added that code to their calendar sees their calendar and reminder update automatically.
- Scheduler Agent finds common free slots and assists with rescheduling.

## 3. Task Intelligence

---

- Live task assignment — host can assign a task mid-meeting, to one person or to everyone at once via Select All.
- Percentage progress tracking (30%, 50%, Done) instead of a simple checkbox, visible live on the host's dashboard.
- Document attachments — participants can attach files when submitting/completing a task.
- Completion-count view — on the due date, host instantly sees how many participants finished versus how many are pending.
- Class/group-organized dashboard — if a host runs separate meetings for different classes or groups, tasks and participant status are shown in separate columns per class rather than one mixed list.
- Auto-detected tasks — the Task Agent picks up action items directly from conversation, working alongside manual/live assignment.

## 4. Meeting Engagement Extras

---

- In-chat polls/votes — host or participants can post a quick poll during the meeting so the host can gauge majority opinion without everyone talking over each other.
- Reactions bar (thumbs up, heart, laugh, clap) — lets people respond without unmuting or interrupting.
- In-meeting profile customization — participants can change their display name and set a profile photo just for that meeting.
- Chat attachments — photo/gallery, contact, and document sharing directly in the chat box.
- Screen share available to host, co-host, and participants — not host-only — visible to everyone.
- Pin a participant so everyone sees them large on screen; if no one is pinned, the view automatically follows whoever is currently speaking.

## 5. Trust, Privacy & Access Control

---

- Explicit recording notice — when recording starts, every participant sees "This meeting is being recorded" with the option to continue or leave.
- Mic/camera permission prompts shown to everyone, including the host, before joining.
- Per-host data isolation — even with many hosts on the platform, each host only ever sees their own meetings' recordings, chats, summaries, and Q&A;/doubt logs.
- Role-based permissions — e.g. a manager/faculty sees everything, while a student/employee only sees their own tasks.
- Domain-restricted rooms — only people with a college email domain can join, unless a guest is explicitly invited.
- End-to-end encryption toggle for sensitive meetings.
- Session timeout / auto-logout for shared devices (e.g. a college lab computer).
- Do Not Disturb sync — the app auto-detects an ongoing meeting and silences phone notifications.

## 6. Usability at Scale (College Context)

---

- Archive search by topic name — find a past meeting even without remembering the exact date.
- Two distinct calendars — a Dashboard Calendar for upcoming meetings (with direct Join/Host actions) and a separate Archive Calendar for past meetings (split into Join and Host tabs).

- No-code Archive access for attended meetings — a meeting the person actually attended (as host or participant) never requires a room code to find in the Archive; only a meeting they were absent from requires the code, and only the very first time.
- Archive-based lookup over blind push notifications — since many classes/branches can run simultaneous meetings, participants retrieve the right recording by date or topic search rather than relying on a notification that might name the wrong meeting.
- Theme toggle — Light and Dark mode, selectable by the user for comfort.
- Low-bandwidth mode — automatically switches to audio-only when the connection is poor.
